Oil derivative supply (PJ)

Oil derivative use (PJ)

Gas supply (PJ)

Gas utilization (PJ)

Coal supply (PJ)

Coal utilization (PJ)

Biomass supply (PJ)

Biomass utilization (PJ)

# Electricity generation (TWh)

Power plant capacity (MW)

This stacked bar chart illustrates the projected global electricity generation mix from 1950 to 2070. The x-axis shows years in 5-year increments, and the y-axis represents electricity generation in TWh, ranging from 0 to 6000. The legend identifies ten energy sources: wind onshore (light blue), solar PV (yellow), solar CSP (orange), others (grey), nuclear (bright yellow), natural gas (ST + CT) (teal), natural gas (CC) (cyan), hydro (dark blue), heavy fuel oil (dark red), coal (black), and biomass (green). The chart shows a significant increase in total capacity starting around 2010, with a peak projected around 2060 before declining. Coal and natural gas are major contributors in the early 21st century, while hydro remains a steady presence. Projections show a massive surge in wind onshore and solar PV capacity towards the end of the century.

Electricity use (TWh)

Primary energy supply (PJ)

Final energy consumption (PJ)

Energy use: Transport (PJ)

Energy use: Industry (PJ)
