

Oil supply (PJ)

Oil derivative supply (PJ)

Oil derivative use (PJ)

Gas supply (PJ)

Gas utilization (PJ)

Coal supply (PJ)

Coal utilization (PJ)

Biomass supply (PJ)

Biomass utilization (PJ)

Electricity generation (TWh)

Power plant capacity (MW)

The chart illustrates the historical and projected electricity generation capacity in the United Kingdom. The x-axis represents years from 1950 to 2070 in 5-year increments. The y-axis represents capacity in GW, ranging from 0 to 100. The bars are stacked by energy source, with the following legend:

- wind onshore (light blue)
- solar PV (yellow)
- solar CSP (orange)
- others (grey)
- nuclear (yellow)
- natural gas (ST + CT) (teal)
- natural gas (CC) (cyan)
- hydro (dark blue)
- heavy fuel oil (dark red)
- coal (black)
- biomass (green)

Key observations from the chart include:

- Capacity remains near zero until the late 1960s.
- Early capacity additions (1970s-1990s) are primarily from hydro, coal, and nuclear.
- A significant increase in capacity begins around 2010, driven by a large expansion in wind onshore and natural gas (ST + CT).
- Projections from 2020 onwards show a continued and rapid increase in capacity, with wind onshore and solar PV becoming the dominant sources by 2070.
- The total capacity is projected to reach approximately 100 GW by 2070.

Electricity use (TWh)

Primary energy supply (PJ)

Final energy consumption (PJ)

Energy use: Transport (PJ)

Energy use: Industry (PJ)

Energy use: Buildings (PJ)

Non-energy use: Feedstock (PJ)
