The chart displays the projected generation mix in the UK from 2015 to 2070. The y-axis represents the percentage of total generation, ranging from 0% to 100% in 10% increments. The x-axis shows the years from 2015 to 2070 in 5-year increments. The legend identifies the following energy sources: wind onshore (light blue), solar PV (yellow), nuclear (orange), natural gas (ST + CT) (light green), natural gas (CC) (dark green), hydro (purple), heavy fuel oil (red), coal (black), and biomass (dark grey).

The generation mix evolves significantly over time. In 2015, the mix is dominated by coal and natural gas. By 2030, nuclear and hydro become more prominent. From 2040 onwards, wind onshore and solar PV show rapid growth, becoming the primary sources of electricity. By 2070, wind onshore and solar PV together account for approximately 70% of the generation mix, with hydro and nuclear also contributing significantly. Coal and heavy fuel oil are phased out by 2050, and natural gas (CC) is phased out by 2060.
